AL-MAFRAQ HOTEL GROUP

Connectivity API access request · Booking.com partner portal

April 2026
Property ID · 14364167

Owner: Osama Qazan
osamaqazan89@gmail.com
3 properties · 1 listed · 2 onboarding
Jordan — Mafraq

1. Executive summary

We operate an **in-house Property Management System (PMS)** built specifically for our hotel group: 3 properties, with property `14364167` (Al-Mafraq Hotel — hotel rooms and serviced apartments) currently listed on Booking.com and two more being onboarded.

We are requesting direct access to Booking.com's Connectivity APIs so we can:

- Maintain a single source of truth in our PMS for rooms, rates, availability, and reservations — without operating a third-party Channel Manager.
- Provide our reception, housekeeping, and accounting teams with real-time two-way sync between our system and Booking.com.
- Scale to 3+ properties under one provider account.

The system is already in production at `https://hotel.aqssat.co` and is used daily by our staff.

2. System overview

Layer	Technology
Runtime	Next.js 16 (App Router) on Node.js
Language	TypeScript (strict mode)
Database	PostgreSQL via Prisma ORM 6
Auth	NextAuth.js (JWT, bcrypt, 2FA-ready)
Realtime	Socket.IO + Postgres LISTEN/NOTIFY triggers
Permissions	Fine-grained RBAC registry with `requirePermission()`
Deployment	Single-region VPS, Nginx reverse proxy, PM2 processes
Credential storage	AES-256-GCM at rest (HKDF-derived key)

All external-integration credentials — including the Booking.com partner credentials used by our internal automation helpers — are encrypted with AES-256-GCM via a keyed HKDF derived from `BOOKING_ENC_KEY` (see `src/lib/booking/encryption.ts`).

3. Data model · direct mapping to Booking Content API

The PMS schema was designed to map 1-to-1 onto Booking.com's object model:

Our Prisma model	Booking.com object
`UnitType` (maxOccupancy, sizeSqm, bedroomCount, livingRoomCount, bathroomCount)	Room / Unit definition
`UnitTypeBed` (BED_TYPE, count, location: BEDROOM | LIVING_ROOM | MAJLIS)	Bed configuration
`Unit`	Physical room/apartment instance
`Rate` (nightly / weekly / monthly)	Rate plan
`Reservation`	Reservation
`Guest`	Customer

A migration script (`prisma/scripts/backfill-unit-types.ts`) is already in place to normalize legacy data into this model. The schema supports Arabic-market specifics that matter for our listings (e.g. a `MAJLIS` bed location for the Arabic floor-seating areas used as sleeping surfaces in some of our apartments).

4. APIs we plan to integrate (priority order)

1. **Content API (Properties + Rooms)** — push our unit types, beds, amenities, photos, descriptions; read back Booking.com validation feedback.
2. **Availability & Rates API (ARI)** — push nightly availability, rates and restrictions (MinLOS, CTA, CTD).
3. **Reservations API** — pull new and modified reservations, acknowledge and handle cancellations.
4. **Messaging API** (optional) — consolidate guest messaging into our internal chat module.
5. **Opportunities API** — ingest opportunities as tasks in our Kanban board.

For each stream we will implement idempotent consumers, exponential-backoff retries, and end-to-end structured logging with correlation IDs.

5. Internal modules already in production

Module	Status	Notes
Reservations	Live	CRUD, check-in/out, deposits, contract PDF
Unit types & beds	Live	Schema described in §3 + seed data
Monthly reports	Live	Revenue, occupancy, ADR, RevPAR, channel mix
Accounting & payroll	Live	Ledger per party, payroll cycles
Tasks (Kanban)	Live	Boards, columns, cards, realtime updates
Internal chat	Live	Conversations, messages, reactions, attachments
Notifications	Live	Socket.IO + Postgres NOTIFY triggers
Permissions	Live	40+ capabilities enforced per API route

6. Security & compliance

- TLS end-to-end (Let's Encrypt, auto-renewed).
- AES-256-GCM at rest for all third-party credentials; no plaintext storage.
- Full audit log for sensitive operations (reservation edits, rate changes, permission changes).
- GDPR-aware: guest data can be anonymized/exported on request.
- Edge rate limiting (`src/lib/rateLimit.ts`).
- Ready to sign and honour a Data Processing Agreement (DPA) with Booking.com.

7. Rollout plan

Phase	Scope	ETA
1	Provider account + sandbox credentials; Content API read-only	2 weeks
2	Content API push for property 14364167	3 weeks
3	ARI push + Reservations pull + certification	4 weeks
4	Onboard remaining 2 properties under the same provider	2 weeks
5	Go-live + monitoring + on-call rotation	1 week

Total: ~12 weeks to full production.

8. What we need from Booking.com

1. A **Provider Account** on `https://developers.booking.com` tied to the owner's account (`osamaqazan89@gmail.com`).
2. Sandbox and production credentials.
3. Certification checklist and mapping of our 3 properties to provider IDs.
4. A named point of contact on the Connectivity Partner Support team during onboarding.

9. Contact

Owner & technical sponsor:	Osama Qazan
Email:	osamaqazan89@gmail.com
Existing Booking property ID:	14364167
System URL:	https://hotel.aqssat.co
Country / city:	Jordan — Mafraq, Al-Zuhour district

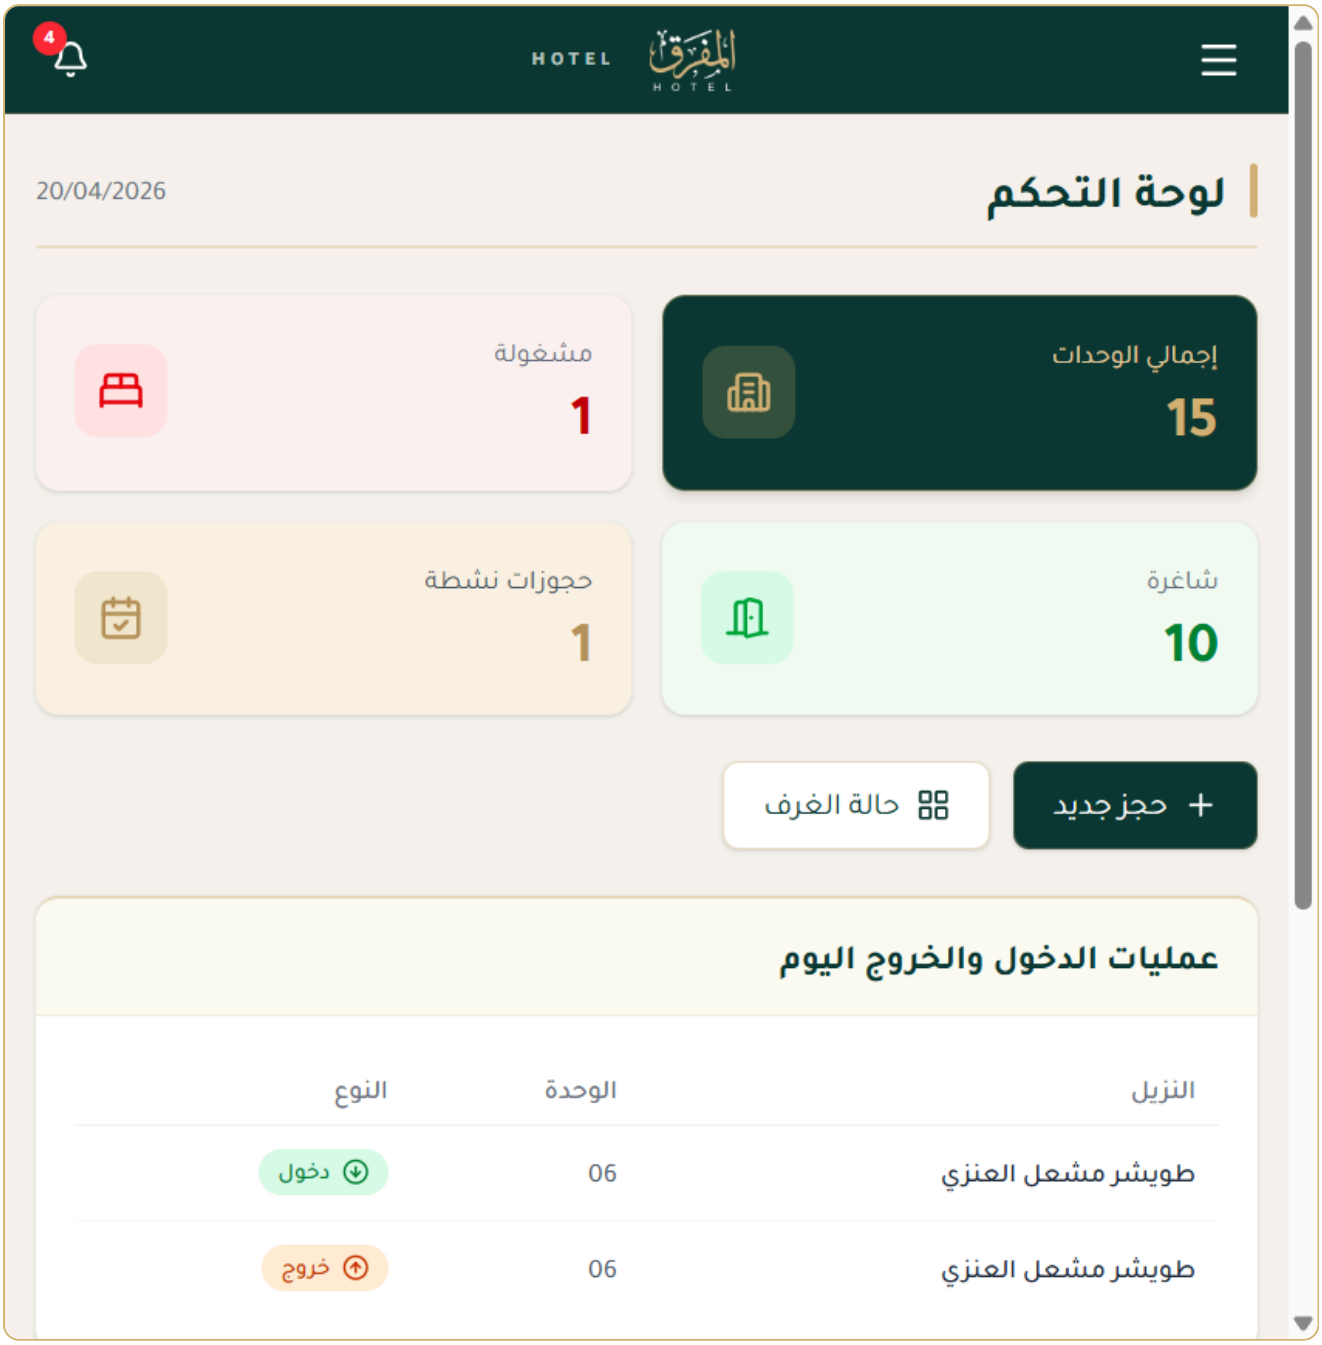
Happy to jump on a call or share a read-only demo account on request.

Appendix · Screenshots from the production system

The following screenshots are captured live from `https://hotel.aqssat.co` (Arabic RTL UI). They illustrate the modules that will consume the Booking.com Connectivity APIs.

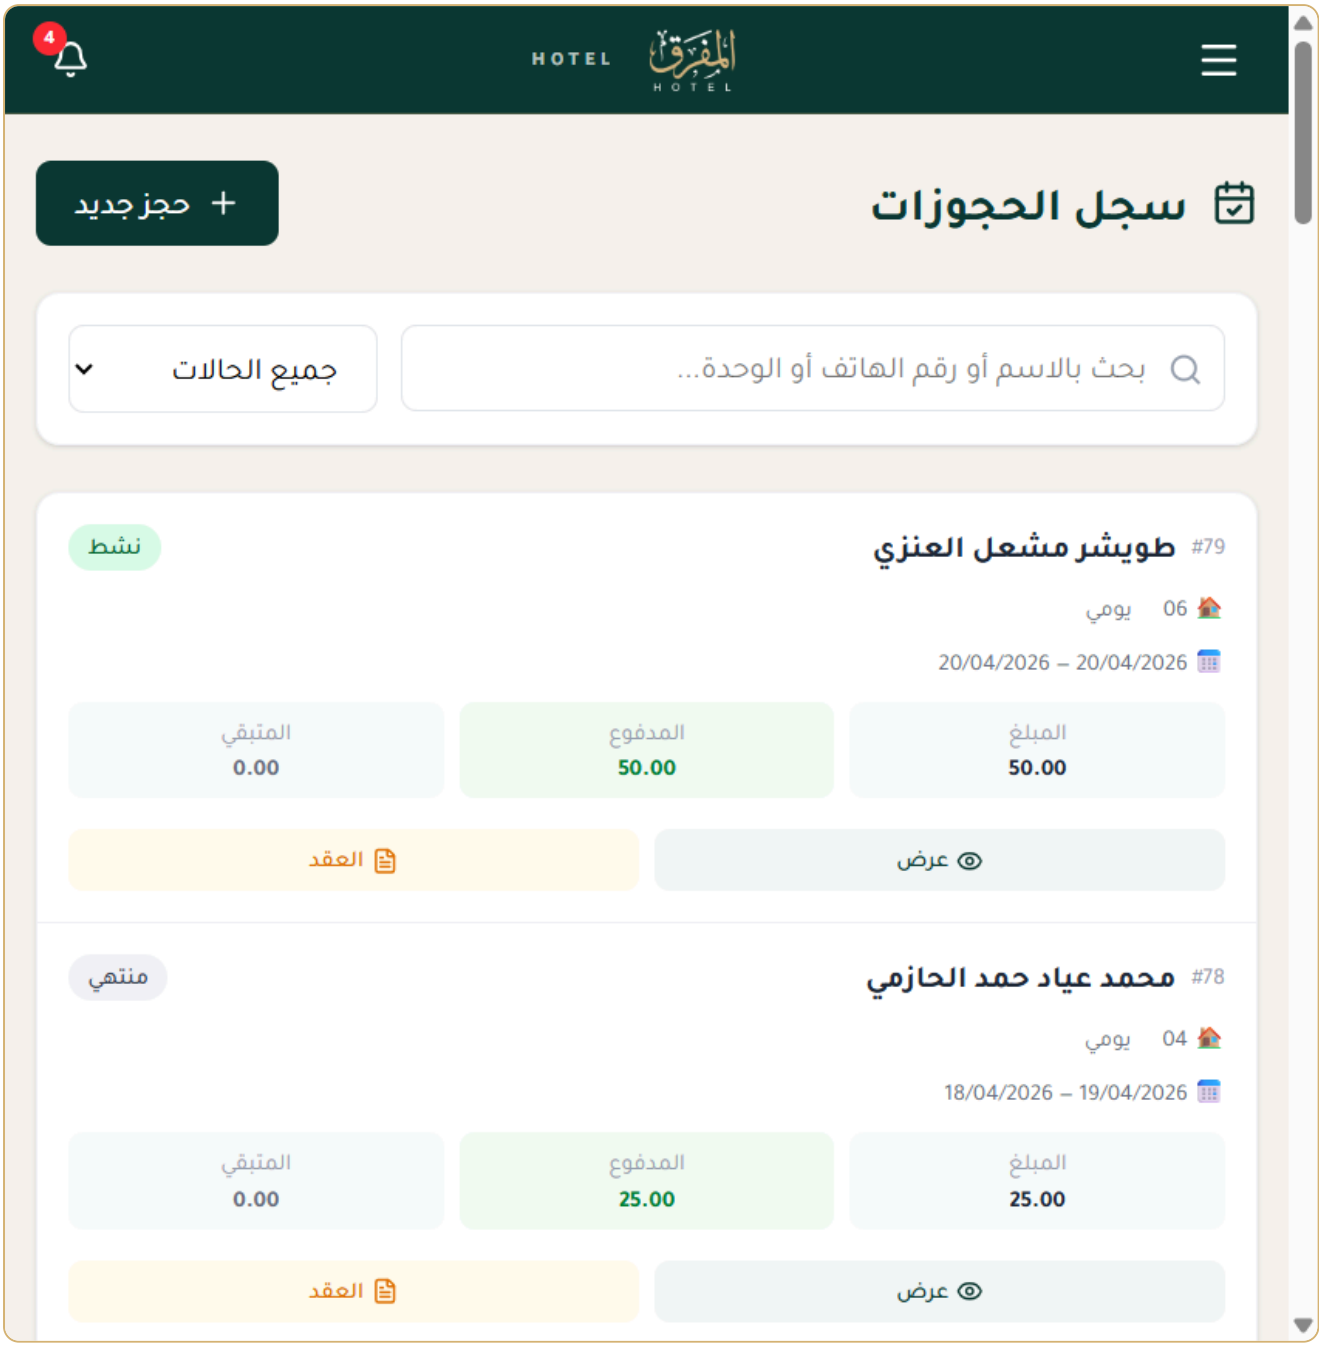
1. Operations dashboard — live KPIs

Total units, occupied, vacant, active reservations, today's check-ins / check-outs. Drives the data that will be pushed as availability to the ARI API.



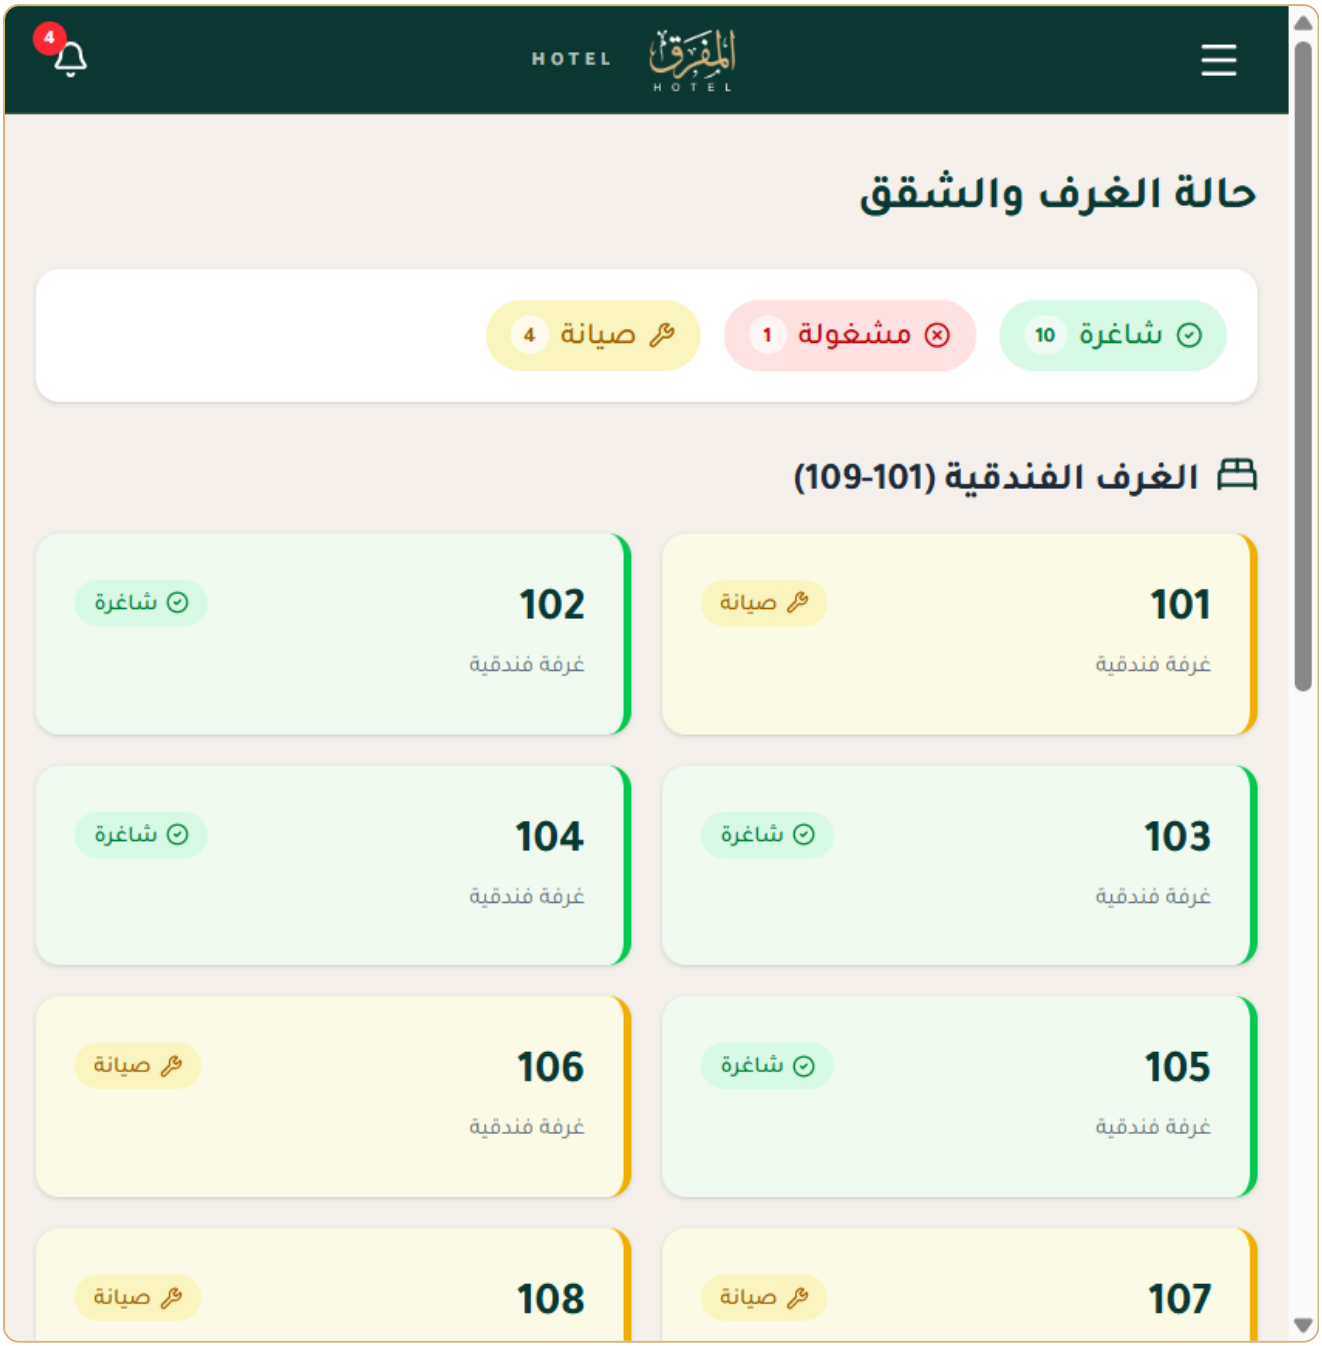
2. Reservations module

Full reservations log with status, dates, amount paid and balance. This is the sink for reservations pulled from the Booking Reservations API.



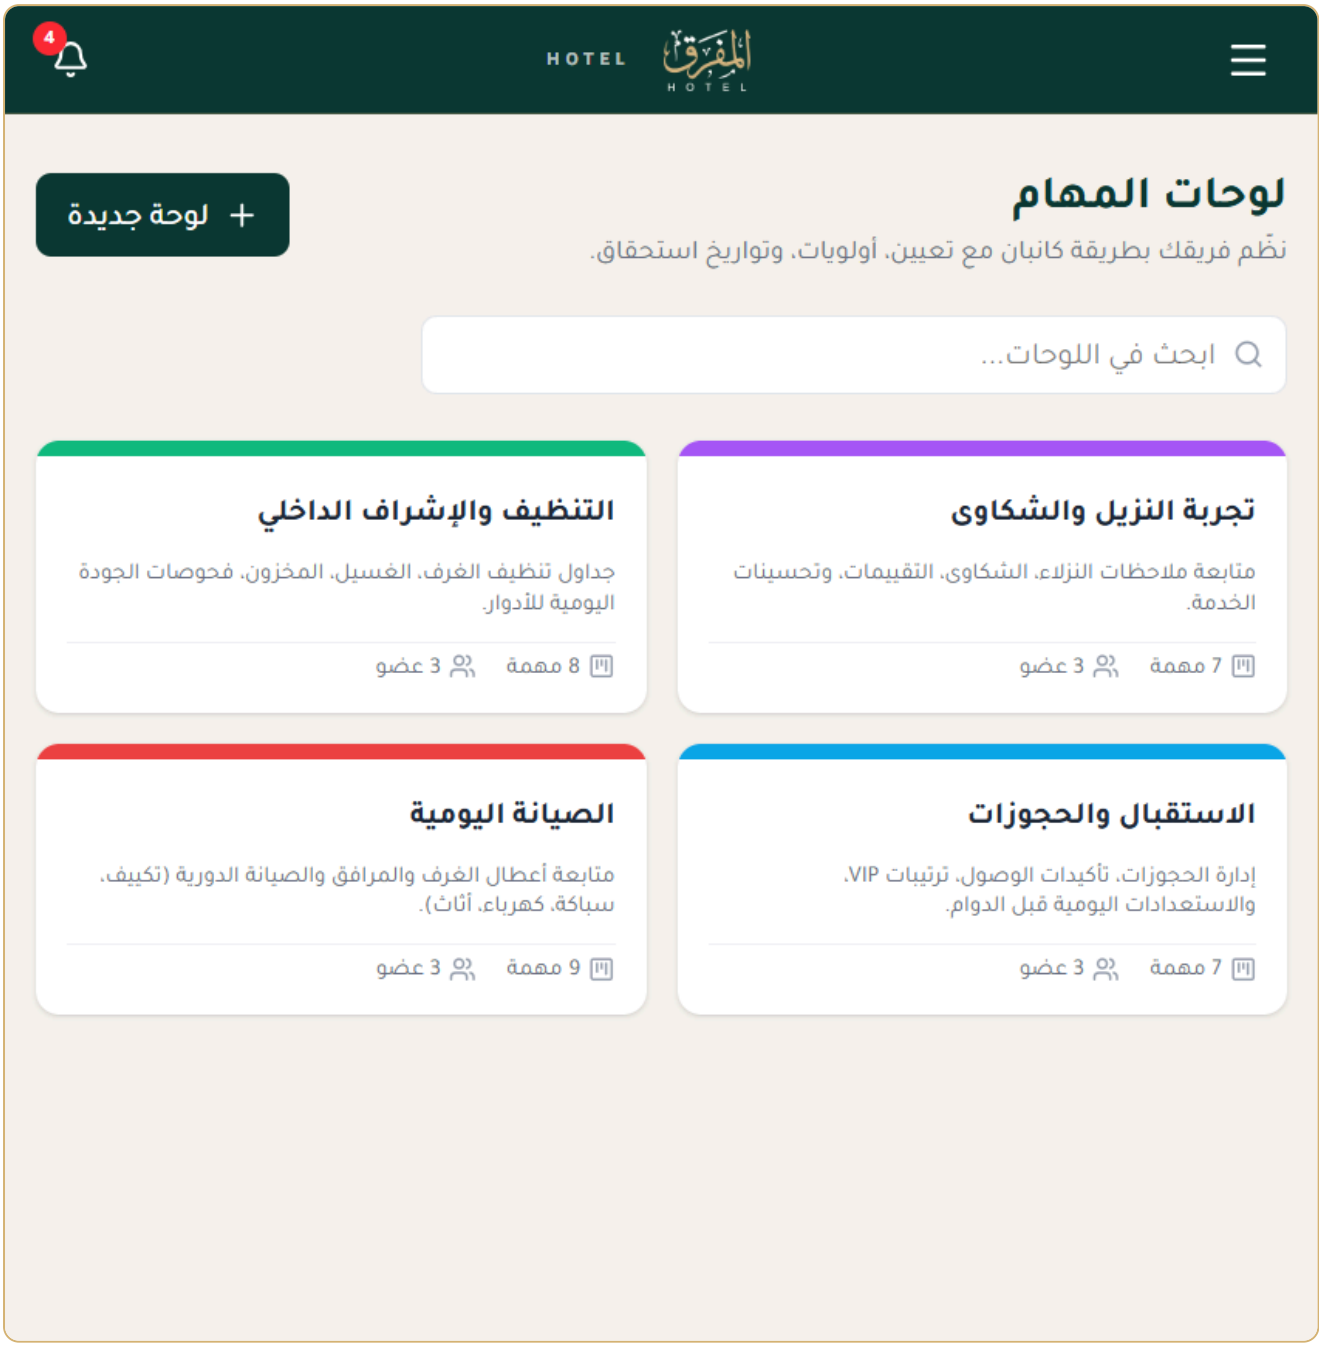
3. Rooms & apartments status

Per-unit status across hotel rooms (101–109) and serviced apartments (01–06). This inventory is the source of truth the Content and ARI APIs will sync.



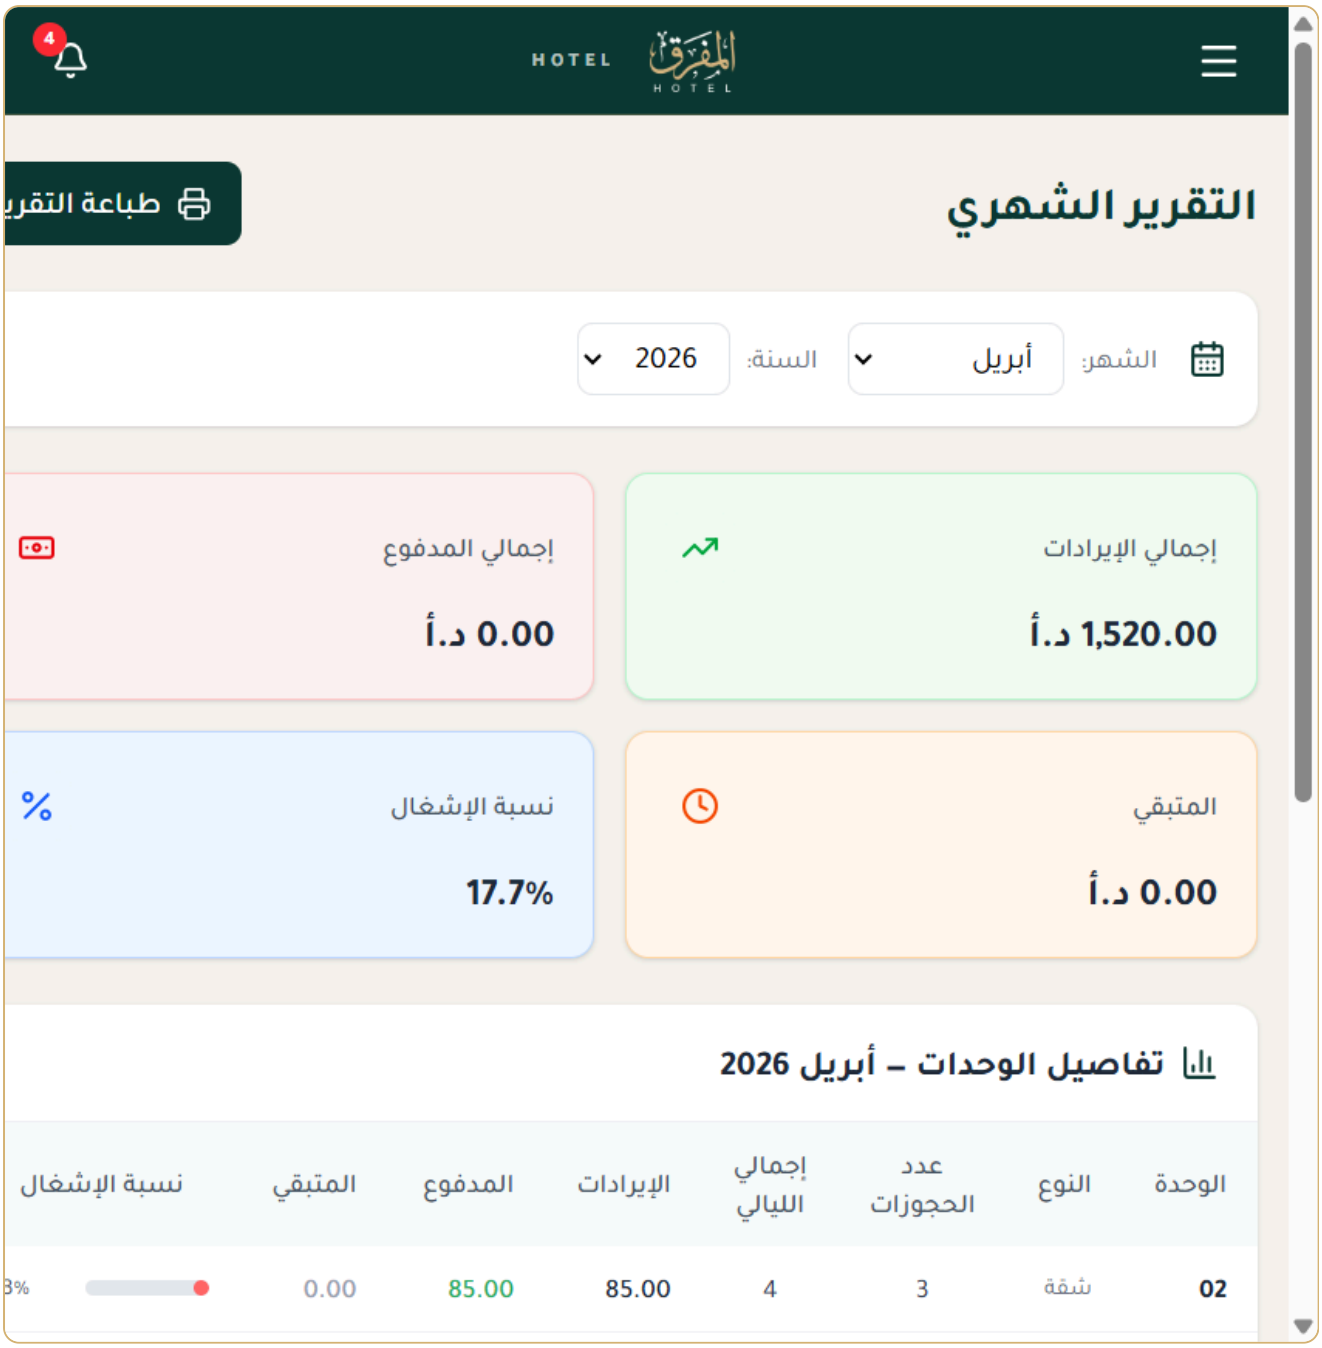
4. Operational Kanban (Tasks)

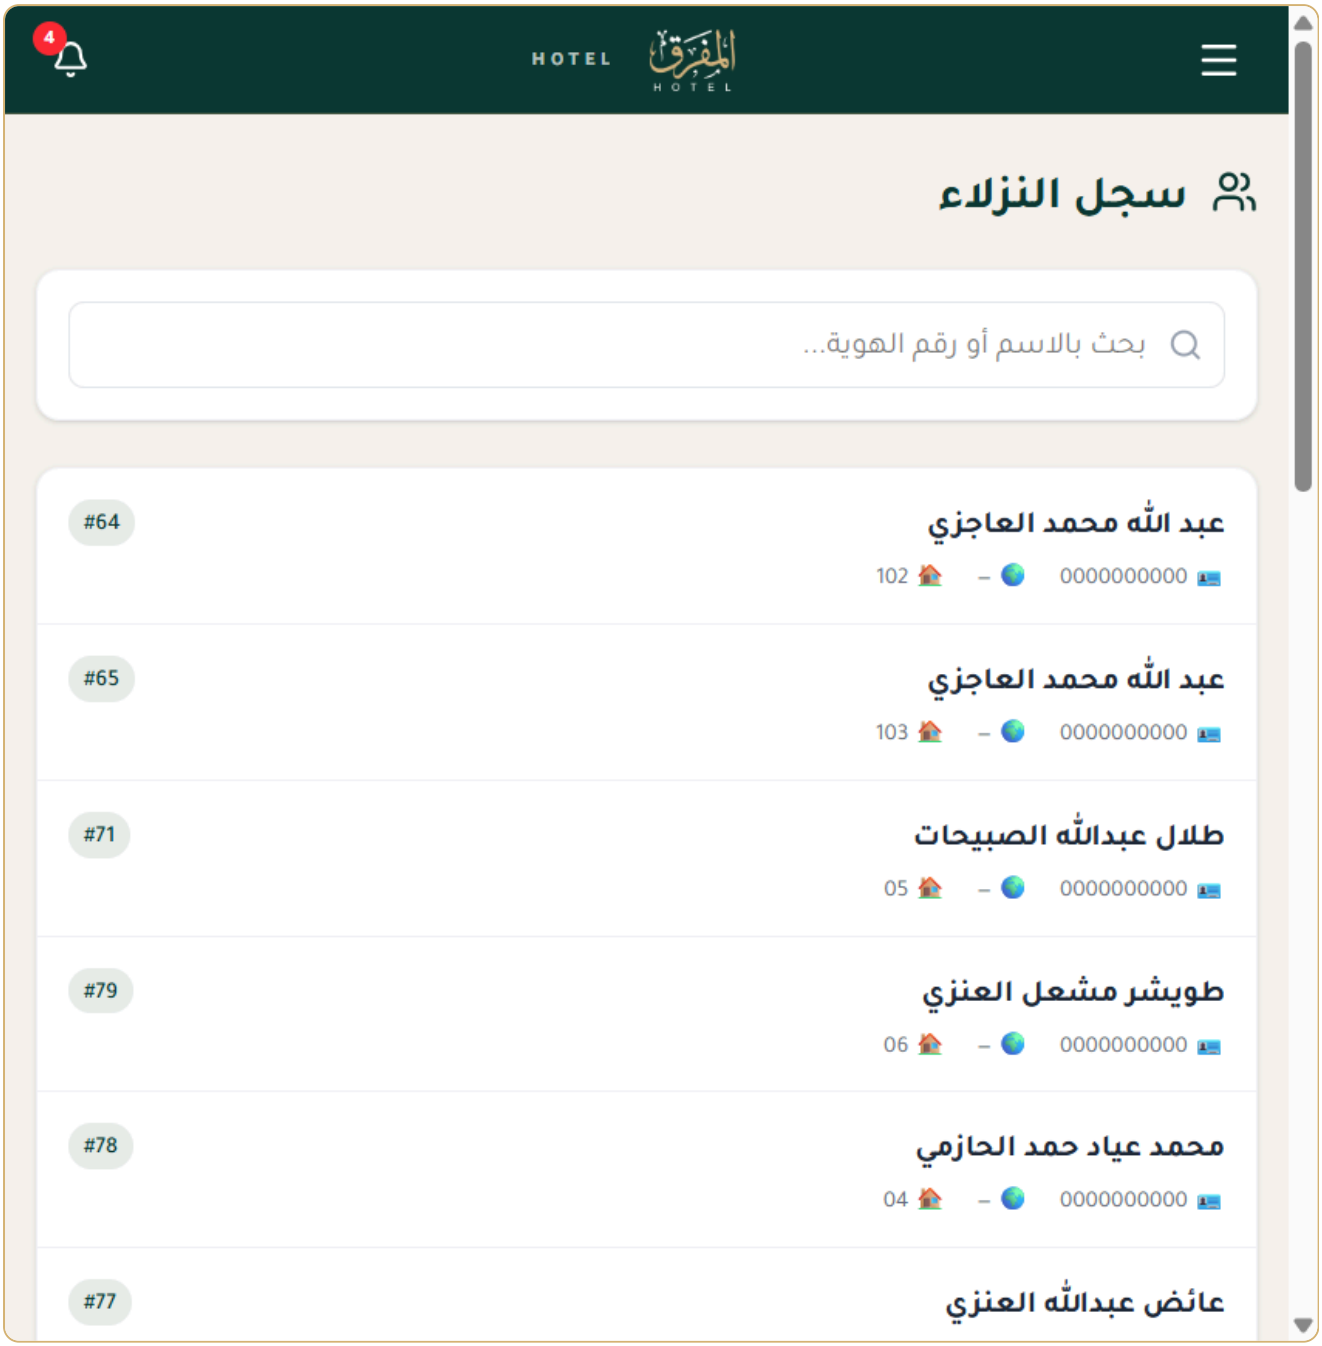
Cross-team boards: guest experience & complaints, housekeeping, reception & reservations, daily maintenance. Opportunities from Booking will be ingested here.



5. Monthly financial & occupancy report

Revenue, ADR, occupancy % per unit. Will enrich with Booking-channel share once APIs are connected.



6. Guest registry


De-duplicated guest profiles with document IDs and stay history. Ready to merge Booking-originated customers on `customerId`.
